

The Rising Tide: Climate Impact in the Pacific.

*“The Melanesian islands are defined by their resilient communities and deep connection to the land, yet they face an intensifying challenge from climate-driven disasters. While the data shows periodic fluctuations in the number of people directly affected by these events from 2005 to 2022, the sharp spikes in recent years- such as the events in 2015 to 2016-reveal a vulnerability that threatens both livelihoods and regional development. This visualization serves a ‘**call to action**’, mapping these impacts to demonstrate the disaster resilience is not just a statistical requirement, but a necessity for the survival of pacific communities.”*
